

Configuring Windows 98 and Millennium PCs

1. Click the **Start** button. Select **Settings** and click the **Control Panel** icon. Double-click the **Network** icon.
2. On the Configuration tab, select the **TCP/IP** line for the applicable Ethernet adapter. Do not choose a TCP/IP entry that says Dial-Up Adapter after it. If the word TCP/IP appears by itself, select that line. Click the **Properties** button.
3. Click the **IP Address** tab. Select **Specify an IP Address**.
If their PC does not have TCP/IP installed, click Start and then Help. Search for the keyword TCP/IP. Then follow the instructions to install TCP/IP.
4. Enter the Specified IP Address and Subnet Mask.
5. Now click the **Gateway** tab, and enter correct gateway address. Click the **OK** button.
6. Now click the **DNS Configuration** tab, and install the proper DNS numbers: 207.41.64.1 and 207.41.64.2.
7. Click the **OK** button again. Windows may ask you for the original Windows installation disk or additional files. Check for the files at c:\windows\options\cabs, or insert your Windows CD-ROM into your CD-ROM drive and check the correct file location, e.g., D:\win98, D:\win9x, etc. (if "D" is the letter of your CD-ROM drive).
8. Windows may ask you to restart your PC. Click the **Yes** button. If Windows does not ask you to restart, restart your computer anyway.
